

PRODUCT INSTALLATION INSTRUCTIONS

Bathroom Faucet Aerator

To complete installation you will need:

- Bathroom faucet aerator (located in your kit)
- Teflon tape (located in your kit)
- Tongue and groove pliers
- Old towel or rag
- Old toothbrush

Instructions

REMOVE OLD AERATOR

1. Place an old towel or rag over the drain in the sink. This will prevent any washers or grit from the faucet arm falling down the drain.
2. To remove the old aerator from the faucet, cover the old aerator with an old towel or rag, and remove using tongue and groove pliers.

CLEAN EXISTING FAUCET

3. Using an old toothbrush and rag, clean and dry the threaded area of the faucet thoroughly.

FLUSH OUT FAUCET PIPE

4. Turn on the water and run for five to ten seconds. This will flush out any residue that might have come loose inside the faucet.

PREPARE FAUCET AERATOR

5. Remove the bathroom faucet aerator from the kit, and place the washers in the proper place after once again drying the faucet threads.

INSTALL NEW FAUCET AERATOR

6. Screw on the new bathroom faucet aerator clockwise and hand tighten until snug. Do not over-tighten.
7. Turn on the faucet and check for leaks. If it leaks, try adding some teflon tape in a clockwise direction to the threads of the aerator. That should do it!
